

Mootools.net

I created a accordion using a mootools plug-in. I think that the accordion is a simple effect, but great change on the site with lack of animation.

I found interested mootools framework because I had learned before JQuery and we may find a framework ready in a project that we will be part of, and can be using mootools as js framework.

I learned that mootools is more compacted than jquery, but it's offer animation, plug-in and others like jquery. According to my research mootools framework is used by 5% of the websites, most of in business sites, and its more complex language comparing to jquery. Another words, jquery is much easier to write, but for a project that requires more than one developer, mootools is appropriated because of mootools development language clarify better the appropriated used of its elements.

We can find in mootools.net many links to mootools develop communities, code demonstration, and many examples of class, element, fx (create) etc.

Mootools is a good js framework for many experienced developer, but for students, I believe that jquery is more efficient, because of the extended library that makes much easier to understand.
